Learning Outcome:

After completing this exercise, you shall be able to:
• Apply loops and conditional statements to solve simple problems.
• Create and manipulate NumPy arrays.
• Implement basic Object-Oriented Programming (OOP) concepts in Python.

Problem Statement:

In this hands-on exercise, you are required to apply your understanding of Python programming, NumPy, and
Object-Oriented Programming (OOP) to solve practical problems. You will write programs using loops and conditional
statements to calculate sales tax, use NumPy to create and manipulate arrays, and implement a simple Bank Account System
using OOP concepts.

The objective is to strengthen your programming and problem-solving skills while
understanding how different Python concepts work together to build simple real-world applications.
You can use any programming environment such as Jupyter Notebook, Google Colab, VS Code, or any
